## Elevation to Eden: A Post Scarcity Society

High Technology, AI and Automation are set to revolutionize work and how we understand work, the ramifications of it are set to usher an unprecedented amount of prosperity and change how we approach work and the economy, leaders and relevant people should be wise and set policies that work with these changes, so that nations are ushered into a post scarcity world, where robots and AI work on producing all the goods and most of the services and humanity is here just to serve its original purpose.

Imagine an artificial intelligence world where robots can do any task a human can do, and more, without being trained, without being tired, without any downsides. Imagine companies run totally by robots: CEO, executives, analysts, engineers, factory workers, managers, researchers, they do the work, they are extremely smart, efficient, they don't tire, they don't falter, they are perfect employees. We elevate to Eden and reach a post scarcity society, no longer we have to work to produce goods and most of the services, everything is provided. It's a totally different economy: subsidized jobs become a complete necessity, social security is part of the government's role, with such a government themes such as privacy, liberty, overreach, individuals rights and discrimination are in necessity of being discussed, having a government that is altruistic, efficient and that protects liberties, privacy, individual rights and protects people from discrimination become a necessity.

This is good, it is the realization of the human endeavor, not only it solves the challenges of scarcity, world hunger, and challenges regarding economic hurdles, but it free us to do whatever we want and that's when jobs that explore the human experience should bloom, but that require a new way of approaching work, and subsidized jobs is the way to do it. When only a few companies can produce goods extremely efficiently and with incredibly cheap labor to produce goods, that means that companies consists of shareholders a board and a few engineers and a lot of credit to employ robots and AI systems, that means that an insurmountable amount of capital would concentrate in these few companies that produce goods, maybe they are even state companies. This would cause a massive income disparity and most people would be

unemployed and without money to buy those goods and services. Someone might make the case that this would just make industries to be created and grown, industries that don't produce goods or produce ever more increasingly complex and abstract goods and services. There's a funny remark that this would maybe even make people be paid to keep each other company. But the fact is that this post scarcity economy would fundamentally change how we understand capitalism, money, and how we relate to each other, the search for meaning would become essential.

## ***Economy***

In this new economy that everything is abundant and all the goods and necessary services are provided by working robots, AI systems and other pieces of high technology. Concentration of wealth forgoes the capitalist model of the economy, since a lot of people have no income from lack of jobs because the model of value producing industries wanes, certainly many industries would spring up in more “abstract” kinds of businesses, businesses that are geared towards serving people in some way, but even then it is certainly a fact that without any planning or intervention, there will be massive concentration of wealth and poverty, even when the goods are extraordinarily very cheap to produce.

So governments have to implement new ways to provide capital and employment to consumers. We, the Stellarium Foundation, have already devised projects to solve that.

*Subsidized Jobs Initiative:* It works when companies apply for the program and the government pays for wages of the employees. This is a very innovative project that can already be implemented and not only provides employment, but it satisfies economic utility in that the market, according to its demands, allocates labor where it's needed.

*Enterprise Pledges:* It's where companies and institutions provide collateral to take on loans to build high demand housing and even farming, since there are high demand enterprises, the risk of default is very low and these parties are doing an extraordinary good only by signing papers and providing collateral on their idle assets.

*The Government Institution To Create Jobs:* A government institution to create jobs and foster industries which will become very necessary.

The importance of the central bank should become more pronounced in providing liquidity to consumers, and stabilizing the economy and fostering the prosperity of markets in an orderly way. I reckon there are to be more tools in the central bank's disposable to accomplish its mission.

### **Governance**

In a post-scarcity society, governance must evolve to address the unique challenges and opportunities presented by advanced technology and automation. The role of government becomes crucial in implementing policies like subsidized jobs and enterprise pledges, which direct capital towards essential needs such as housing and farming.

This era needs “The Good Leadership” , a concept I've coined before. The Good Leadership deeply cares about the people and makes decisions based on universal laws and principles.

The Good Leadership:

- Is initiated, wise and well versed in principles such as economy, science, management and justice.
- Is not personally motivated, or politically motivated, rather it is motivated by principles and heavenly laws.
- Understand concepts such as privacy, human nature, liberty and plurality of cultures.
- Not populists, but de facto architects.
- Serves the good of the people, not facilitated profits, counterproductive lobbying and practices.

## **Liberty**

Liberty in a post-scarcity world involves protecting individual freedoms in an environment where basic needs are met by machines. Privacy, surveillance, and the concentration of power are significant concerns. Governance must balance regulation with the protection of personal liberties, ensuring that AI and automation do not infringe on individual rights.

We uphold that the law be divided into criminal law and civil law, criminal law as a minimal subset of laws on offenses that directly cause physical or material harm and incur penalties such as loss of life or liberty, for more information check our website. Civil law would be any other law regulating the dealings between people that doesn't cause harm.

It is necessary that the laws be simple for people to understand and follow, and also that there must be a lot of leeway for individual expression and plurality of cultures, while also maintaining a set of laws governing crimes. These must be the universal standard.

## **Plurality**

Plurality refers to the diversity of perspectives, cultures, and ways of life that should be celebrated in a post-scarcity society. With material constraints lifted, people's whole occupation will be in relationships, arts, hobbies and entertainment, that would certainly cause the rise of a gamma of ideologically diverse communities and the task of the government is to preserve liberties and foster tolerance in society. Governance should support and celebrate diversity yet ensuring social cohesion. This involves creating inclusive institutions that encourage collaboration and mutual respect, while addressing potential pressures to conform to certain cultural norms.

## Human Experience

The human experience in a post-scarcity society is redefined by the absence of traditional work and the presence of abundant resources. People have the freedom to pursue passions and engage in creative, meaningful activities. However, this transition raises existential questions about purpose and meaning. Society must foster environments that support personal growth, creativity, fulfillment and jobs, potentially through retraining programs and new educational models.

As we say the purpose of life is to:

- Do Good
- Have Fun
- Make Money

As we tell you exactly what is the meaning of life for whoever wants to know and sway any unnecessary complexities of life. This is our lot, it is our God given right.

## Elevating To Eden

Elevating to Eden is possible, and this book is a guideline, it is very important that the guidelines proposed in my writings are obeyed because there are ways that it could not be so good. Let's relish in the potentials and applications of automation and let's build and architect a society where there is happiness, liberty, satisfaction, enjoyment, understanding, plurality, prosperity and purpose. Peace.

JOHN VICTOR
